

55% of healthcare IT leaders see moderate-to-high email breach risk

More than half of healthcare IT leaders expect their next breach to come through email.

What we found

55% of healthcare IT leaders believe their organization is at moderate to high risk for an email-related data breach.

This is not abstract worry. Leaders are naming email as their most likely breach vector, and the data on breaches and phishing backs them up.

What it means for buyers

The risk is proven

85% of organizations had an email-related breach in the past year.

Defenses feel inadequate

60% admit their email security measures are inadequate.

Confidence is low

Only 23% are confident their email security is fully effective.
